SHIPPING CONTAINER MOUNTING NUT AND BOLT HIGH

ISO Shipping container corner nut and bolt to aid the support of Channel Brackets.

No drilling into container and easy to fit. A single central M12 specially designed nut to sit inside the corner casting of a shipping container and when tightened with a Channel Bracket BE305 etc will give the strongest support required. With one used at the top and bottom then a scaffold pole connected between gives a very stable support. This will still allow the container door to open 180 degrees. Channel brackets and 'U' & 'V' bolts sold seperately

The simplicity of the design is in the special nut which locates into the cast corner on either of the faces, with the 60mm nut face on the top slot and the 45mm nut face on the side slot, which then allows a single spanner to lock everything up tight, because the nut will not rotate or pull through the slot.

Tools required to install the bracket are 1 x M19 spanner.

Note. All of our Channel Brackets come with a 13mm centrally drilled hole to suit this application. BE305, BE306, BE309 and BE310.

Finish: Sherardized

Part used in the modular " XS SYSTEM " designed by BARENCO
